# MÅLGRUPPE FOR BROBYGGERSYGEPLEJERSKER

- Kan ”noget anden en typisk hospitalsomsorg/sygepleje” og ‘går på tværs af hospitalsafsnit og sektorer’
- Patienten er typisk:
  - Multimorbide med sociale udfordringer
  - Genindlæggelser
- BBS omfavner patienten psykosociale behov i en biomedicinsk kontekst og danner følgeskab med patienten på tværs af hospital og sektorer.
- Arbejder med personcentreret sygepleje

## Something else than usual hospital nursing care: An ethnographic study of nurse case managers' everyday practices

Mette Geil Kollerup<sup>1,2</sup>, Connie Berthelsen<sup>3,4</sup> , Mette Grønkjær<sup>2,5</sup> and Birgitte Lerbæk<sup>2,6,7</sup>

### Abstract

Support interventions, such as nurse case managers, has been developed in response to the inequality in health and a growing population with multi-morbidity. The aim of the present study was to explore the everyday practices of nurse case managers at a Danish university hospital. An ethnographic approach with a constructionist perspective was applied. Data generation entailed participant observation and one group interviews with all nurse case managers in a Danish region ( $n = 4$ ). The data were analysed using thematic analysis. The everyday practices of nurse case managers were characterised by providing something else than the usual hospital nursing care by continuously establishing and maintaining relationships with their patients. They emphasised the patient's psychosocial needs in a biomedical context and accompanied patients across different healthcare settings. The nurse case managers' everyday practices resonate with the key values of nursing. These values are under pressure in healthcare dominated by technical rationality and efficiency leading to increased inequality in health. Further exploration of the potential benefits for multi-morbidity and co-existing social issues is needed. There is a need for continued critical debate about the conditions for caring for patients' psychosocial needs. The implications of continuing to neglect patients' psychosocial needs are related to further increasing inequality in health and impeding equal access to services.

### Background

The increased prevalence of people experiencing multimorbidity has been a global concern for several decades. In Denmark, one-third of the population experiences multimorbidity, which is described as two or more chronic physical and/or mental conditions.<sup>1</sup> Healthcare settings are experiencing an increasing number of patients with multimorbidity. These patients can be challenging in hospitals due to the highly specialised and hierarchical structures that characterise these settings. Healthcare systems are structured in a general healthcare division and specialist services. This impedes options for coherent care, creating barriers to the provision of person-centred care. In the Danish context, such fragmented organisations are sustained by a division of healthcare resources between municipal and regional health authorities, structures and ongoing changes in health care, as well as in population demographics, health behaviour and for care coordination services.<sup>2</sup> In response to the population experiencing multimorbidity, various interventions in healthcare have been developed.<sup>3,4</sup>

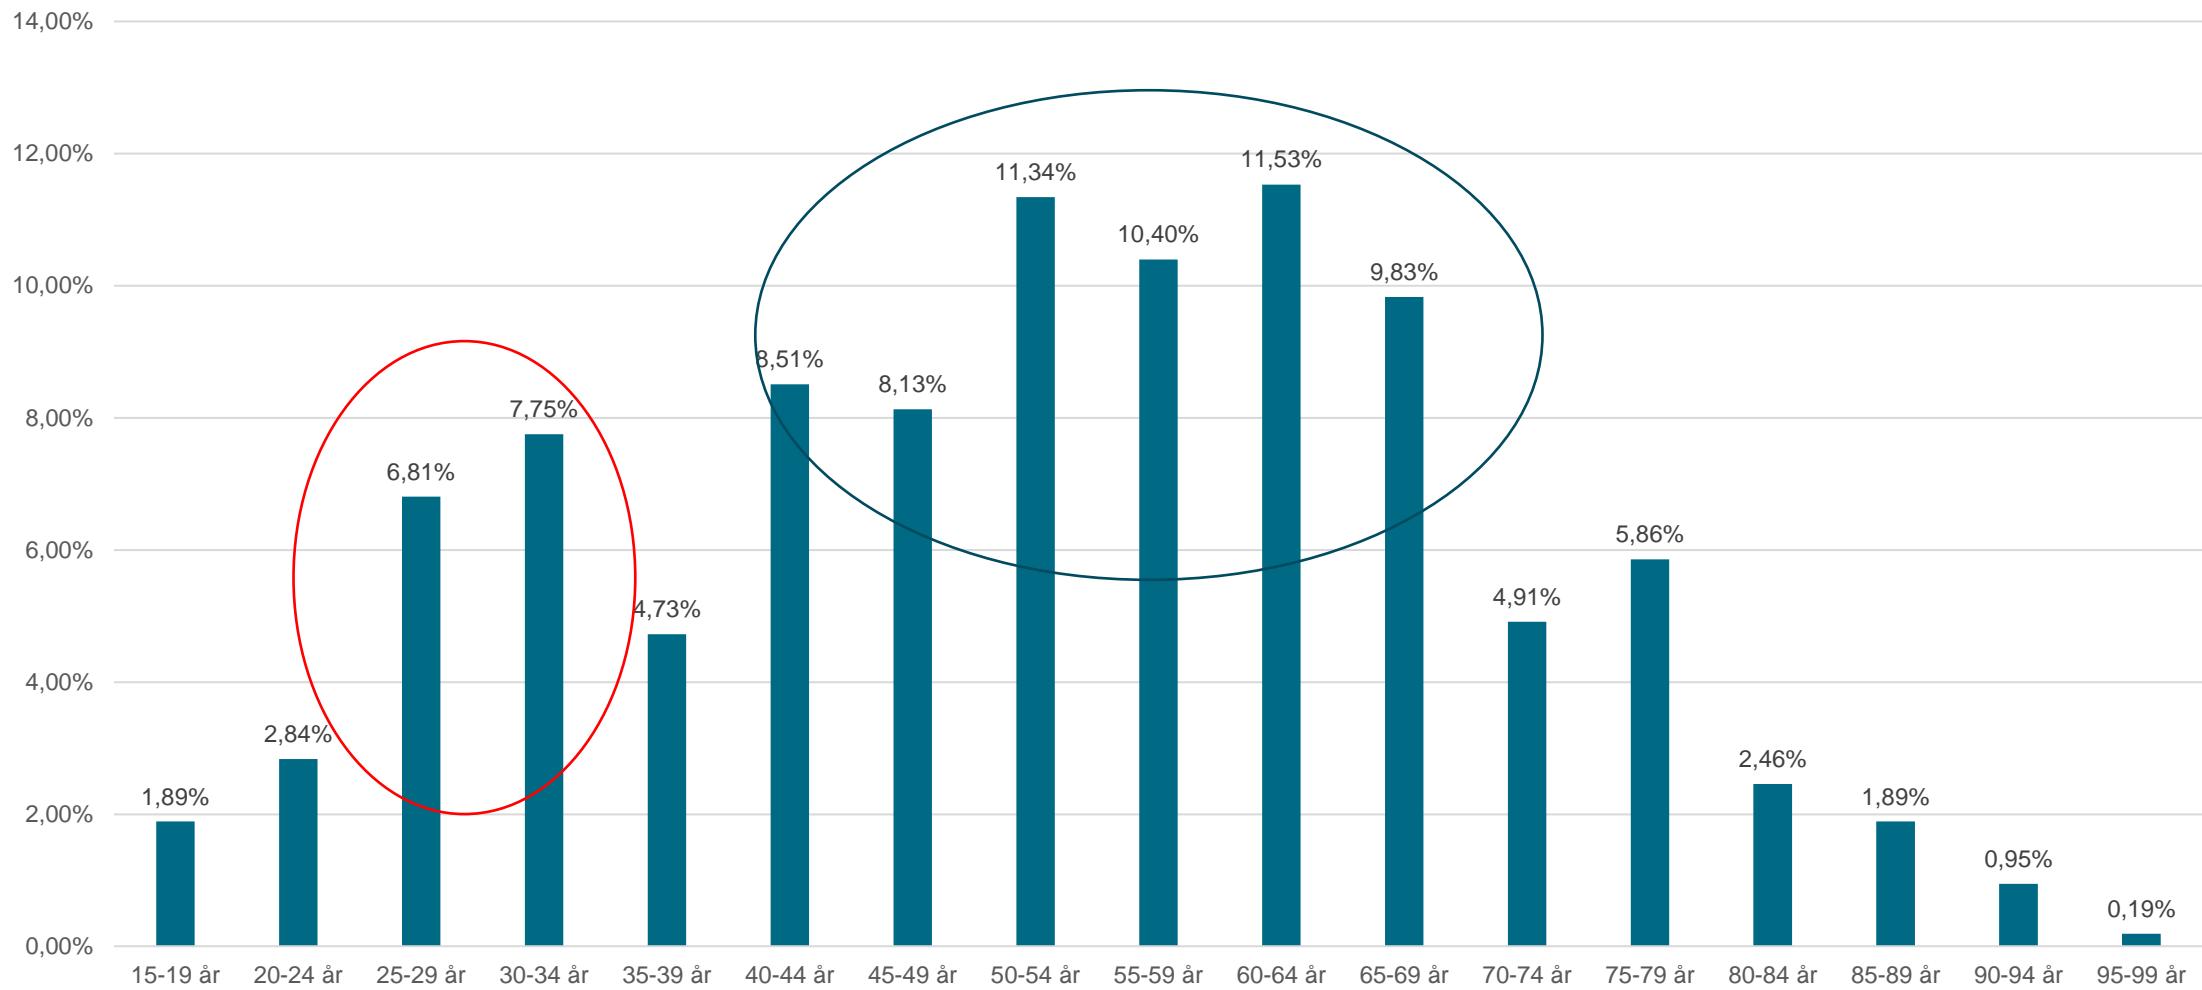

The nurse case manager (NCM) service was developed in the 1970s in response to concerns about the costs and quality of outcomes caused by changes in society, population

demographics and population health status. Changes in the 1970s – and today – include advances in healthcare technology, and the increased incidence of chronic diseases, such as diabetes mellitus and hypertension. The NCM is a case management role that aims to coordinate care for patients with complex needs. The NCM works in a multidisciplinary team and is responsible for monitoring and evaluating the patient's progress. The NCM also provides support to the patient and their family, and helps them to access other healthcare services. The NCM is a key figure in the healthcare system, and plays a crucial role in ensuring that patients receive the best possible care. The NCM is also involved in the development of new healthcare policies and practices. The NCM is a valuable member of the healthcare team, and is essential for providing high-quality care to patients with complex needs.
